Given the provided data, what are three conclusions that we can draw about crowdfunding campaigns?

According to the data, the campaign had good outcomes, with an average of 851.1469 comparing to failed results

What are some limitations of this dataset?

There are not many limitations, however, we could have better results if we knew the exact average donation for each parent and sub-category with repetitive names

What are some other possible tables and/or graphs that we could create, and what additional value would they provide?

Bar, pie, and scatter charts. Each chart would represent a different way to represent the same results as well as give us the options to filter and modify it accordingly to what is needed.
